

Scraper comments

Joseph Klaus sent this note.

The one I came up with was Packard woodworks Henry Taylor side cutting scraper 104059 HT Dia. Side Cutting Scraper

Ken Shepherd submitted the following.

A long time ago I went looking for a box scraper and couldn't find one. I went out and bought a BN 1" scraper (cheap) and made a handle. Then I ground it down to about 1/2 " on the end, and 2.5" on the left side to make a square angel on the end. Works good with a box tool rest that we made at a special meeting. A drawing is shown below.

Al Michaud sent the following.

I have a scraper not quite ground square but scrapes on front and left side. The name on it is BAHCO of Sweden and is number 967 and has a shark stamped on it. Don't know the steel type but is very well made and heavy. The end of scraper is 3/4 in. Don't know if this helps but I must have picked it up at Liberty Tool at some time.

From Jorge Castaneda

Here is a pic of my square scrapper, I did grind on the side of the wheel a small \square at, When I am making boxes or goblets, the bulk is removed with a round scraper and then the wall of the piece is trued with this scraper. I like that it lets me see what the tool is doing and more important, only 1/2" is touching the wood, rather than the whole side of the scraper.

That massive 1/2" thick scraper is V10 (A!!) same steel as Doug Thompson's tools, it is thicker than the Thompson's, good to overhang over the tool rest; That was probably made by Glasser.

Using a 1/4" scraper one cannot overhang, so a tool rest that fits inside the cavity is used
